

PANDAS DATA CLEANING & ACCESS METHODS

*Complete Guide to **DataFrame** Cleaning, Selection, Transformation, and Manipulation Methods*

Method	Description
<code>DataFrame.at[]</code>	Gets the value of the specified position
<code>DataFrame.iat[]</code>	Gets or sets the value of the specified position
<code>DataFrame.get()</code>	Returns specified column(s) from the DataFrame
<code>DataFrame.head()</code>	Returns first 5 rows if number not specified
<code>DataFrame.tail()</code>	Returns last rows of the DataFrame
<code>DataFrame.iloc[]</code>	Gets or sets values using index positions
<code>DataFrame.loc[]</code>	Gets or sets values using labels
<code>DataFrame.keys()</code>	Returns column names as Index object
<code>DataFrame.nlargest()</code>	Returns largest values in descending order
<code>DataFrame.nsmallest()</code>	Returns smallest values in ascending order
<code>DataFrame.take()</code>	Returns specified elements
<code>DataFrame.filter()</code>	Returns rows or columns specified in filter

Method	Description
<code>DataFrame.concat()</code>	Joins two DataFrames together
<code>DataFrame.join()</code>	Joins two DataFrames

Method	Description
<code>DataFrame.axes</code>	Returns row and column labels
<code>DataFrame.columns</code>	Returns labels of each column
<code>DataFrame.info()</code>	Prints DataFrame information
<code>DataFrame.empty</code>	Returns True if DataFrame is empty

Method	Description
<code>DataFrame.drop()</code>	Removes specified row or column
<code>DataFrame.drop_duplicates()</code>	Removes duplicate rows
<code>DataFrame.duplicated()</code>	Checks duplicate values
<code>DataFrame.isin()</code>	Checks if values exist in DataFrame
<code>DataFrame.isna()</code>	Checks NOT A NUMBER values
<code>DataFrame.isnull()</code>	Checks NULL values

<code>DataFrame.notna()</code>	Finds non-NaN values
<code>DataFrame.notnull()</code>	Finds non-NULL values
<code>DataFrame.bfill()</code>	Replaces NULL values using next row value

DATAFRAME

Method	Description
<code>DataFrame.add_prefix()</code>	Adds prefix to column names
<code>DataFrame.add_suffix()</code>	Adds suffix to column names
<code>DataFrame.assign()</code>	Adds new column to <code>DataFrame</code>
<code>DataFrame.combine_first()</code>	Combines <code>DataFrames</code> using non-null values
<code>DataFrame.T</code>	Transposes rows into columns
<code>DataFrame.transpose()</code>	Turns rows into columns and columns into rows
<code>DataFrame.combine()</code>	Combines <code>DataFrames</code> using function
<code>DataFrame.corr()</code>	Finds correlation between columns
<code>DataFrame.astype()</code>	Changes data type
<code>DataFrame.convert_dtypes()</code>	Converts data types automatically
<code>DataFrame.copy()</code>	Creates copy of <code>DataFrame</code>
<code>DataFrame.dtypes</code>	Shows data type of each column
<code>DataFrame.groupby()</code>	Groups data and applies functions
<code>DataFrame.insert()</code>	Inserts new column
<code>DataFrame.melt()</code>	Reshapes <code>DataFrame</code> into long format
<code>DataFrame.memory_usage()</code>	Shows memory usage of columns
<code>DataFrame.ndim</code>	Returns number of dimensions
<code>DataFrame.nunique()</code>	Returns count of unique values
<code>DataFrame.pop()</code>	Removes element from <code>DataFrame</code>
<code>DataFrame.query()</code>	Queries the <code>DataFrame</code>
<code>DataFrame.reindex()</code>	Changes labels of <code>DataFrame</code>
<code>DataFrame.rename()</code>	Changes labels of axes
<code>DataFrame.rename_axis()</code>	Changes axis names
<code>DataFrame.replace()</code>	Replaces specified values
<code>DataFrame.reset_index()</code>	Resets index
<code>DataFrame.round()</code>	Rounds values
<code>DataFrame.sample()</code>	Returns random rows
<code>DataFrame.select_dtypes()</code>	Selects columns by data type
<code>DataFrame.shape</code>	Returns rows and columns count
<code>DataFrame.set_axis()</code>	Sets axis labels
<code>DataFrame.set_flags()</code>	Returns <code>DataFrame</code> with specified flags
<code>DataFrame.set_index()</code>	Sets <code>DataFrame</code> index
<code>DataFrame.size</code>	Returns total elements count
<code>DataFrame.sort_index()</code>	Sorts by index labels
<code>DataFrame.sort_values()</code>	Sorts by values
<code>DataFrame.squeeze()</code>	Converts single column <code>DataFrame</code> into Series
<code>DataFrame.update()</code>	Updates <code>DataFrame</code> using another <code>DataFrame</code>

DataFrame.value_counts()	Returns unique rows count
DataFrame.values	Returns NumPy array
DataFrame.var()	Returns variance
DataFrame.where()	Replaces values based on condition

Method	Description
DataFrame.transform()	Executes function for each value
DataFrame.apply()	Applies function along axis
DataFrame.applymap()	Applies function to entire DataFrame
