

PANDAS IMPORTANT MATHEMATICAL METHODS

Method	Description
<code>DataFrame.sum()</code>	Returns the sum of the values in the specified axis
<code>DataFrame.cumsum()</code>	<code>DataFrame</code> with the cumulative sum for each row
<code>DataFrame.add()</code>	Adds any number into given data
<code>DataFrame.agg(['sum'])</code>	Sum of all numeric values in each dictionary
<code>DataFrame.radd()</code>	Reverse-adds values of one <code>DataFrame</code> with another
<code>DataFrame.count()</code>	Counts the number of non-null values in each row

Method	Description
<code>DataFrame.sub()</code>	Subtracts the values of a <code>DataFrame</code> with specified values
<code>DataFrame.rsub()</code>	Reverse-subtracts values of one <code>DataFrame</code> from another

Method	Description
<code>DataFrame.cumprod()</code>	Cumulative product for each row
<code>DataFrame.dot()</code>	Multiplies values from one <code>DataFrame</code> with another
<code>DataFrame.mul()</code>	Multiplies each value with a specified value
<code>DataFrame.pow()</code>	Raises values of one <code>DataFrame</code> to another
<code>DataFrame.prod()</code>	Returns product of all values in specified axis
<code>DataFrame.product()</code>	Returns product of values in specified axis
<code>DataFrame.rmul()</code>	Reverse-multiplies values of one <code>DataFrame</code> with another
<code>DataFrame.rpow()</code>	Reverse-raises values of one <code>DataFrame</code>

Method	Description
<code>DataFrame.div()</code>	Divides each value with a specified value
<code>DataFrame.floordiv()</code>	Divides and returns integer values
<code>DataFrame.mod()</code>	Finds remainder of <code>DataFrame</code> values
<code>DataFrame.rdiv()</code>	Reverse-divides one <code>DataFrame</code> with another
<code>DataFrame.rfloordiv()</code>	Reverse floor division of <code>DataFrames</code>

<code>DataFrame.rmod()</code>	Reverse modulus operation
<code>DataFrame.truediv()</code>	Divides values with specified values
<code>DataFrame.rtruediv()</code>	Reverse true division of <code>DataFrames</code>

Method	Description
<code>DataFrame.cummax()</code>	Cumulative maximum values
<code>DataFrame.idxmax()</code>	Returns index of maximum value for each column
<code>DataFrame.max()</code>	Returns maximum value of each column

Method	Description
<code>DataFrame.cummin()</code>	Cumulative minimum values
<code>DataFrame.idxmin()</code>	Returns index of minimum value for each column
<code>DataFrame.min()</code>	Returns minimum values in specified axis

Method	Description
<code>DataFrame.mean()</code>	Returns mean value of each column
<code>DataFrame.median()</code>	Returns median value of each column
<code>DataFrame.mode()</code>	Returns mode of values in specified axis

Method	Description
<code>DataFrame.eq(value)</code>	Returns True if values are equal
<code>DataFrame.ge(value)</code>	Returns True for greater than or equal values
<code>DataFrame.gt(value)</code>	Returns True for greater than values
<code>DataFrame.le(value)</code>	Returns True for less than or equal values
<code>DataFrame.lt(value)</code>	Returns True for less than values
<code>DataFrame.ne(value)</code>	Returns True for not equal values
<code>DataFrame.equals()</code>	Compares two <code>DataFrames</code>

Method	Description
<code>DataFrame.cov()</code>	Finds covariance for each column
<code>DataFrame.diff()</code>	Difference between current and previous row
<code>DataFrame.abs()</code>	Converts negative values to absolute positive values
